

Physics IV
ISI B.Math
HW set 1
Marks :25

1. A and B travel at $4c/5$ and $3c/5$ with respect to the ground, as shown in the figure. How fast should C travel so that she sees both A and B approaching her at the same speed? What is this speed? (5)

2. A travels at a speed v with respect to the ground, and B is at rest, as shown in the figure. How fast should C travel so that she sees A and B approaching her at the same speed? In the ground frame (B 's frame), what is the ratio between the distances CB and AC (assume that A and C arrive at B at the same time)? (5)

3. By this time you must be tired of trains and balls being thrown on them, but here is yet another one. A train with proper length L moves with speed $c/2$ with respect to the ground. A ball is thrown from the back to front at a speed $c/3$ with respect to the train. How much time does this take, and what distance does the ball cover in

- (a) the train frame? (1)
- (b) the ground frame? Solve this by
 - (i) using a velocity addition argument (2)
 - (ii) Using the Lorentz transformations to go from the train frame to the ground frame. (2)
- (c) the ball frame? (1)
- (d) Verify that the invariant interval is indeed the same. (3)
- (e) Show that the times in the ball frame and the ground frame are related by the relevant γ factor. (2)
- (f) Show the same thing as (e) for the ball frame and train frame (2)
- (g) Show that the times on the train frame and the ground frame are NOT related by the relevant γ factor. Why not? (2)
